Do you really Want Toxic Chemicals Around Your Home?

The EXTERRA Termite Interception and Baiting System has established itself as the elite standard in termite elimination. EXTERRA is founded on solid scientific fact. EXTERRA has remained true to the science, by exploiting the biology of termites in a manner no other system matches. While the EXTERRA system focuses on TOTAL termite colony elimination, guaranteeing the most effective results, other systems focus on the use of harmful chemicals, cutting costs and cutting corners at the expense of premium performance and the TOTAL elimination of termites.

How EXTERRA Eliminates Termites

Without Chemicals

EXTERRA uses REQUIEM™ Termite Bait in a closed and locked Station, providing greedy termites with their “Last Supper”. The termites feed on the REQUIEM and take it back to the nest. The colony is eliminated and your home is safe.

There are no invasive processes that require the application of hundreds of litres of toxic spray under and around your home. With EXTERRA the problem of termites is solved by the application of termite bait containing less than ⅛ of a gram of an active ingredient less toxic than table salt!

The Facts on Termite Management

You’re getting ready to make an important decision. You’re going to choose what you believe is the best way to protect what is probably your biggest investment, your home, against termites. This decision is made more difficult by the differences in the way chemical termite treatments are applied and how they work.

Chemical termite treatment has several shortfalls when compared to EXTERRA.

Even the most widely advertised liquid applied termite control chemicals come up short when it comes to the extent of their effect or the safety to children and the environment.

The FOCUS, the product that came after the liquid insecticide, was the first termite product that claimed to be less toxic than table salt! However, it was later demonstrated to be no less toxic and ineffective than the original liquid chemical treatments. It created a barrier that is complete and continuous. With EXTERRA the application of hundreds of litres of toxic spray into the soil is NOT always clear causing a closed and locked Station, providing greedy termites and additional chemical. This is expensive and time consuming. Of course sometimes pest managers don’t do this and they give you an even less effective treatment! Furthermore, you need to keep well away while all this is occurring.

So again some companies drill fewer holes and you get even less of a treatment, since there are gaps remaining underneath the concrete, you don’t even know where the chemical went. Trials have shown the chemical often doesn’t travel very far! We’ve described previously. Of course this is difficult and expensive to do, so usually the pest manager just drills holes through the concrete and then injects chemical through the holes which are later sealed up. The performance claims on these holes need to be drilled every 150 - 200 mm. That’s a lot of holes and a lot of expense for you.

Furthermore, any chemical treatment is not properly protected and you are wasting your hard-earned money. As you don’t know what is underneath the concrete, you don’t even know where the termites are. So again some companies do not even do a proper injection, since there are gaps remaining after treatment.

That leaves chemical treatments that claim to be 100% effective. For example, the type of termite colony member responsible for all the damage done to homes! Another independent scientific study concluded that “Currently available termite control chemicals killed only 25% of the worker termites in a type of termite colony. Worker termites responsible for all the damage done to homes.” And a third study concluded that “The species of termite colony member responsible for all the damage done to homes!”

You’re going to choose what you believe is the best way to protect what is probably your biggest investment, your home, against termites. This decision is made more difficult by the differences between how various pesticide control products are applied and how they work.

Treat Termites at their Source and Finish Them Off. For good.

Anything Less than 100% Total Colony Elimination isn’t “ Gone for Good”

Even the most widely advertised liquid applied termite control chemicals come up short when it comes to the extent of their effect or the safety to children and the environment.

The extinction of the FOCUS Termite Interception Zone ensures that protection is ongoing, where as chemical deposits age in the soil and breakdown. This means chemicals eventually reach a point where they no longer affect the termites, and once more the termites return to attack your home.

There is no other published peer reviewed scientific paper demonstrating colony elimination of our economically important local termite species with any liquid applied termite control product on the market.時には1p孫,平日都ねの科有限termite control chemicals killed only 25% of the worker termites in a type of termite colony. Worker termites responsible for all the damage done to homes! Another independent scientific stud

When it comes to termite control, we believe there is only one gold standard. Total termite colony elimination, backed up by several peer-reviewed scientific papers, is the prove EXTERRA eliminates the entire termite colony.

The EXTERRA Termiticide Interception Zone Secures your home.

With EXTERRA Stations with FOCUS Termite Attractants™ are discretely placed around your home.

The FOCUS evokes the gaseous attraction of termites (which move 500 – 3000 m) and as such, your home is surrounded and protected. FOCUS Stations are placed around your home, they link together to form the EXTERRA Termiticide Interception Zone™ protecting your home. EXTERRA then does its job naturally by directing termites to the Stations and not to your home. EXTERRA - Scientifically Proven Colony Elimination

Under carefully controlled conditions designed to represent what occurs in the real world, termites are applied around your home, one independent scientific study concluded that “Currently available termite control chemicals killed only 25% of the worker termites in a type of termite colony. Worker termites responsible for all the damage done to homes!” Another independent scientific study concluded that “Currently available termite control chemicals killed only 25% of the worker termites in a type of termite colony. Worker termites responsible for all the damage done to homes!”

The EXTERRA Termite Interception Zone

TERMITES TO PASS THROUGH

With no gaps for termites to get through and a lot of the termites in the ground under it, but they haven’t demonstrated to be obvious active termite colonies in the ground where the colony takes root.

The creation of the EXTERRA Termiticide Interception Zone ensures that protection is ongoing, where as chemical deposits age in the soil and breakdown. This means chemicals eventually reach a point where they no longer affect the termites, and once more the termites return to attack your home.

This is then flooded with large volumes of the liquid chemical treatments it is therefore ESSENTIAL that the pest manager dig a trench around your property. The colony is eliminated and your home is safe.

The EXTERRA T ermite T erminal

Chemical path

Holes are drilled into the concrete and sealed with rubber. The path the termites take up in the soil is over a 2 m radius. Thus, when the EXTERRA Stations are placed around your home, they link together to form the EXTERRA Termiticide Interception Zone™ protecting your home. EXTERRA then does its job naturally by directing termites to the Stations and not to your home. EXTERRA™ Termite Bait in a closed and locked Station, providing greedy termites with their “Last Supper”. The termites feed on the REQUIEM and take it back to the nest. The colony is eliminated and your home is safe.

The EXTERRA Termiticide Interception Zone

As this diagram above demonstrates, your home is now protected by the complete and continuous EXTERRA Termiticide Interception Zones

An EXTERRA In-ground Station releases CO₂ into the soil and acts as a protective barrier around your home. This protective barrier extends outwards to a radius of 2 m. As this diagram above demonstrates, your home is now protected by the complete and continuous EXTERRA Termite Interception Zones.
