Termite Tips

• DO have your licensed Pest Control Operator conduct thorough inspections of your home and surrounds at least every 12 months, and more frequently in high risk situations.

• DO keep all sub-floor areas clean, dry and well ventilated where possible.

• DO fix up leaking plumbing eg: downpipes, gutters and taps, and ensure that there is good drainage around the house.

• DO NOT build up soil, mulch or garden beds against the house.

• DO NOT store timber or wood-based materials under or against the house.

Termidor delivers these outstanding advantages:

• Unique Transfer Effect™ for unequalled termite control

• Fast elimination of termite activity

• Non-repellent

• No effect on soil micro-organisms, earth worms and plants

• Water-based

• Long-term residual control

The performance of Termidor has been proven around the world, in all types of conditions, and in the most difficult to control situations.

Here's proof that termites can destroy your home.
Termites can destroy your home

Termites are incredibly destructive insects. They can cause significant damage to homes, buildings, and even infrastructure. In Australia, it is estimated that termite damage costs homeowners and insurers over $2 billion each year. This damage can occur in a matter of months, and if left unattended, can result in extensive and costly repairs.

How to turn termites Inside-Out

Termites are attracted to the warmth and moisture found in homes and other structures. They use this warmth to maintain their body temperature and create a suitable environment for their colonies. This makes it crucial to keep your home cool and dry to prevent termites from infesting it.

While each product is toxic to termites, very few of the termites are actually killed by the termiticide barrier. As a result, termites repair any damage they have caused in the barrier in order to gain access to the home. They do this over and over again until they find a way through.

Termiticides are usually applied in the form of a spray or dust, which is then distributed throughout the treated area. This can include the foundation of the home, as well as the interior and exterior walls. In addition, some termiticides may be applied to the soil around the perimeter of the home, which can help prevent termites from entering through cracks or gaps.

Termiticide (Termidor), the perfect combination, both inside and outside your home. Some termiticides are repellent and rely on keeping termites away from the home. Some termiticides are used in combination with other treatment methods, such as baits or physical barriers.

Termidor Dust

Termidor Dust is the culmination of over 10 years research to make it the perfect termite soil treatment product. Termidor Dust has been tested for effectiveness in terms of killing termites before they can reach the home. Termidor Dust is applied by a licensed pest control professional to the ground surrounding the home. This ensures that termites are killed before they can reach the home, providing long-term protection.

Termidor Inside-Out controls termites

The performance of Termidor has been proven around the world, in all types of conditions, and in many of the most difficult-to-control situations. This unique Transfer Effect is achieved by termite treatment in such a way that termites are attracted to the treated soil and then carry the active ingredient back to the nest. This means that the termites are exposed to the termiticide barrier before they reach the home. As a result, the termites are killed before they can reach the home and destroy it. This provides long-term protection against termites.

With a unique mode of action, the Termidor Inside-Out program will not only eliminate the current activity, but will also provide long-term protection against termite entry and will continue to control termites for at least 8 years. The program is further enhanced by the fact that it provides a non-repellent treatment, which means that termites will not be able to detect or avoid the treated soil. This makes the program extremely effective against all types of termites, including those that are dormant or hard to detect.

Conclusion

Termites can cause significant damage to homes and buildings. However, with the right treatment and preventative measures, it is possible to prevent termites from causing damage. By keeping your home cool and dry, and using effective termiticides, you can protect your home from termite damage.

It's your home, why risk it?
